CS 341 Automata Theory Elaine Rich Homework 6

Due: Tuesday, February 21

This assignment covers Chapter 9 and a review of regular languages.

Chapter 9

1)		fine a decision procedure for each of the following questions. Argue that each of your decision procedures res the correct answer and terminates.
	a)	Given two DFSMs M_1 and M_2 , is $L(M_1) = L(M_2)^R$?
		Procedure: First, take M_1 and construct a new machine M_1' as follows. Create a new start state and provide epsilon transitions to every accepting state of M_1 . Then mark these states as non accepting and mark the old start state as accepting. Now take every state transition and reverse it. Now minimize M_1' and M_2 and compare them. If they are the same machine, then $L(M_1) = L(M_2)^R$ so return $True$. Otherwise return $False$.
		<i>Proof:</i> Since M_1 is finite, the conversion procedure will terminate, and the procedure to compare two FSMs has been established in the book to both terminate and be correct.
	b)	Given an FSM M and a regular expression α , is it true that $L(M)$ and $L(\alpha)$ are both finite and M accepts exactly two more strings than α generates.
		Procedure: First, determine if $L(M)$ and $L(\alpha)$ are both finite. For M , $L(M)$ is finite iff M has no loops, and for α , $L(\alpha)$ is finite iff α contains neither $*$ nor $+$. If at least one is not finite, return False. Now, if both of them are finite, list and count all the strings each generates. If $ L(M) = 2 + L(\alpha) $ then return $True$, else return $False$.
		<i>Proof:</i> Since both FSMs and regular expressions are finite, they can be inspected for loops or $*$ and $+$ to determine whether or not they represent finite languages in finite time. If both languages are finite, the number of strings in each language can be counted in finite time, so this procedure must terminate. If one of the languages is not finite, this will return $False$, and if their cardinality is not as specified it will return $False$, and otherwise it will return $True$, so it must be correct.
Re	evi	ew
2)	Fo	r each of the following languages L , state whether or not L is regular. Prove your answer.
	a)	$\{w\in\{0,1,\#\}^*\ :\ w=x\#y, \text{ where } x,y\in\{0,1\}^* \text{ and } x \cdot y \equiv_5 0\}. \text{ (Let \cdot mean integer multiplication)}.$
		Answer: Regular. \Box
		<i>Proof:</i> If $ x \cdot y \equiv_5 0$, then either $5\mid x $ or $5\mid y $, so this language is represented by the regular expression: $((0\cup 1)(0\cup 1)(0\cup 1)(0\cup 1)(0\cup 1))^*\#(0\cup 1)^*\oplus((0\cup 1)(0\cup 1)(0\cup 1)(0\cup 1))^*$
	b)	$\{w \in \{1\}^*: w \text{ is, for some } n \geq 1, \text{ the unary encoding of } 10^n\}. \text{ (So } L = \{11111111111, \ 1^{100}, \ 1^{1000}, \ \ldots\}.)$
		Answer: Not Regular.
		<i>Proof:</i> Let w be 1^{10^k} . Then by the Pumping Theorem, $y = 1^p$ for some integer p where $1 \le p \le k$. Now pump out once to generate a new string $w' = 1^{10^k - p}$. Since $p \le k$, w' cannot be in the language.

Therefore this language is not regular.

3)	Define a color word to be an English word that is the are red, fuschia, and other. Define an animal wor of an animal. So some example animal words are considered a sentence with legal English syntax and the number words in w . As examples, observe that red cats like the balls $\notin L$. Note that, to be in L , w must satisfy the state to make sense. So, for example, red red blue red that L is not regular. (Be particularly careful if you that is actually in L .)	d to be an English word that is the common name ow, cats, and hippopotamus. Let $L = \{w : w \text{ is } e \text{ of color words in } w \text{ equals the number of animal like catnip } \in L$, but red cats like blue green syntactic rules of English. It is not necessary for w cats like dogs and dogs end dogs $\in L$. Prove			
	Proof:				
4)	4) In this problem, we consider a very restricted subset of Boolean expressions. Define an operator to be one of the four symbols: \neg , \wedge , \vee , and \rightarrow . Define a variable to be one of the five symbols: P, Q, R, and T. Let $L = \{w : w \text{ is a syntactically legal Boolean expression } without parentheses and the number operators in w is exactly equal to the number of variables in w. Examples:$				
	$ \neg P \to Q P \land R \land \neg S \to R P \to Q \neg \neg P $	is in L . is in L . is not in L . is not in L .			
	Is L regular? Prove your answer.				
	Answer: Yes, L is regular.				
	Proof: Let $V = (P \cup Q \cup R \cup S \cup T)$ and $B = (\land \cup \lor (VB)^* \neg V(BV)^*$	$\cup \rightarrow$). L is represented by this regular expression:			
5)	For each of the following claims, state whether it is T	rue or False. Prove your answer.			
	a) If $L = L_1L_2$ and L is regular then L_1 and L_2 must	be regular.			
	Answer: False.				
	Proof: Let $L_1 = \{w : a^n b^m \ n \ge m\}$. Let $L_2 = \{w \text{ is not regular, and since } L_1 \text{ is a letter substitution letter substitution, } L_2 \text{ must be non regular as well regular.}$	of L_2 and the regular languages are closed under			
	b) $(\neg(\neg L)$ is regular) $\rightarrow (L \text{ is regular}).$				
	Answer: True.				
	Proof: $\neg(\neg L) = L$				
	c) $(L_1 - L_2 \text{ is regular}) \to (L_1 \text{ is regular}).$				
	Answer: False.				
	<i>Proof:</i> Let L_1 and L_2 both be A^nB^n , which has be which is regular.	been proven to be non regular. Then $L_1 - L_2 = \emptyset$,			

d) $(L^R \text{ is regular}) \to (L \text{ is regular}).$

	Answer: True.	
	<i>Proof:</i> The regular languages are closed under reverse, and $L=(L^R)^R$.	
e)	For any language $L, L \cup \{a^nb^n : n \ge 0\}$ must not regular.	
	Answer: False.	
	<i>Proof:</i> Let $L = (a \cup b)^*$. Then $L \cup \{a^n b^n : n \ge 0\} = (a \cup b)^*$, which is regular.	
f)	Given any language L , it cannot be true that $L - \{a^n b^n : n \ge 0\}$ is regular.	
	Answer: False.	
	<i>Proof:</i> Let $L = \{a^nb^n : n \ge 0\}$. Then $L - \{a^nb^n : n \ge 0\} = \emptyset$, which is regular.	
g)	The finite languages are closed under Kleene star.	
	Answer: False.	
	<i>Proof:</i> Let $L = \{a\}$. Then L is finite and L^* is not finite.
